The scientific message

Since 2014 and almost 90 scientific papers just to say that :

The idea that information spreads like a virus is almost inconsistent.

Online users, indeed, tend to seek information that is most aligned with their pre-existing beliefs, ignoring dissenting viewpoints and joining clusters of like-minded individuals, where shared narratives may be collectively shaped and reinforced.

This “echo chamber” effect and related heightened polarization may vary across different social media platforms according to their feed algorithms primarily designed to prioritize user engagement instead of accurate information dissemination.

Prezzo del Cuscinetto ipnotico, L. 9,50 franco di porto nel regno
Esclusiva depositaria per l'Italia: **Lega Italiana**, via Fra Domenico n. 9, Firenze

L'insigne chimico e valentissimo botanico Dott. Dixon di Chicago, di fama mondiale nei suoi lunghi viaggi attraverso il globo, e specialmente nelle Indie orientali, ha scoperto una pianta che vegeta sulle sponde del Brahmaputra nei distretti di Goalpara, il *Sassa*, che ha potenti proprietà ipnotiche. Unendo il succo condensato di tale pianta ad altre e col *Luppolo* (conosciuto, questo *ad antea* solo nelle nordiche regioni come facilitante il sonno se assorbito il suo olio volatile per le vie respiratorie), è riuscito, dopo lunghe ripetute ricerche e scientifiche esperienze, ad ottenere un *mezzo sicuro, infallibile*, nel maggior numero dei casi, per conciliare il sonno, senza disturbare lo stomaco coll'ingerimento di farmaci, i quali, se producono un torpore cerebrale conciliante il sonno finiscono coll'apportare gravi, irreparabili inconvenienti all'organismo.

Dal **CUSCINETTO IPNOTICO** sul quale il malato posa la testa a guisa di comodo origliere, emanano gli aëri gradevoli di dette piante sonnifere, e nello stesso tempo assolutamente innocue ai nevralgici più sensibili, come alle donne affette da isterismo il più acuto. A poco a poco, mediante l'azione calmante ed ipnotica degli oli volatili di questi benefici vegetali, l'eccitazione nervosa cessa, le cellule cerebrali dolcemente si assopiscono e il sonno calmo e ristoratore viene in breve ad esercitare la sua azione riparatrice sul malato nel cui animo ritorna la pace, l'amore alla vita che poco prima egli aveva detestata.

Edited by Matjaz Perc, University of Maribor, Maribor, Slovenia, and accepted by the Editorial Board December 4, 2015 (received for review September 1, 2015)

The wide availability of user-provided content in online social media facilitates the aggregation of people around common interests, worldviews, and narratives. However, the World Wide Web (WWW) also allows for the rapid dissemination of unsubstantiated rumors and conspiracy theories that often elicit rapid, large, but naive social responses such as the recent case of Jade Helm 15—where a simple military exercise turned out to be perceived as the beginning of a new civil war in the United States. In this work, we address the determinants governing misinformation spreading through a thorough quantitative analysis. In particular, we focus on how Facebook users consume information related to two distinct narratives: scientific and conspiracy news. We find that, although consumers of scientific and conspiracy stories present similar consumption patterns with respect to content, cascade dynamics differ. Selective exposure to content is the primary driver of content diffusion and generates the formation of homogeneous clusters, i.e., “echo chambers.” Indeed, homogeneity appears to be the primary driver for the diffusion of contents and each echo chamber has its own cascade dynamics. Finally, we introduce a data-driven percolation model mimicking rumor spreading and we show that homogeneity and polarization are the main determinants for predicting cascades’ size.

misinformation | virality | Facebook | rumor spreading | cascades

The massive diffusion of sociotechnical systems and micro-blogging platforms on the World Wide Web (WWW) creates

the main difference between the two is content verifiability. The generators of scientific information and their data, methods, and outcomes are readily identifiable and available. The origins of conspiracy theories are often unknown and their content is strongly disengaged from mainstream society and sharply divergent from recommended practices (22), e.g., the belief that vaccines cause autism.

Massive digital misinformation is becoming pervasive in online social media to the extent that it has been listed by the World Economic Forum (WEF) as one of the main threats to our society (23). To counteract this trend, algorithmic-driven solutions have been proposed (24–29), e.g., Google (30) is developing a trustworthiness score to rank the results of queries. Similarly, Facebook has proposed a community-driven approach where users can flag false content to correct the newsfeed algorithm. This issue is controversial, however, because it raises fears that the free circulation of content may be threatened and that the proposed algorithms may not be accurate or effective (10, 11, 31). Often conspiracists will denounce attempts to debunk false information as acts of misinformation.

Whether a claim (either substantiated or not) is accepted by an individual is strongly influenced by social norms and by the claim’s coherence with the individual’s belief system—i.e., confirmation bias (32, 33). Many mechanisms animate the flow of false information that generates false beliefs in an individual, which, once adopted, are rarely corrected (34–37).

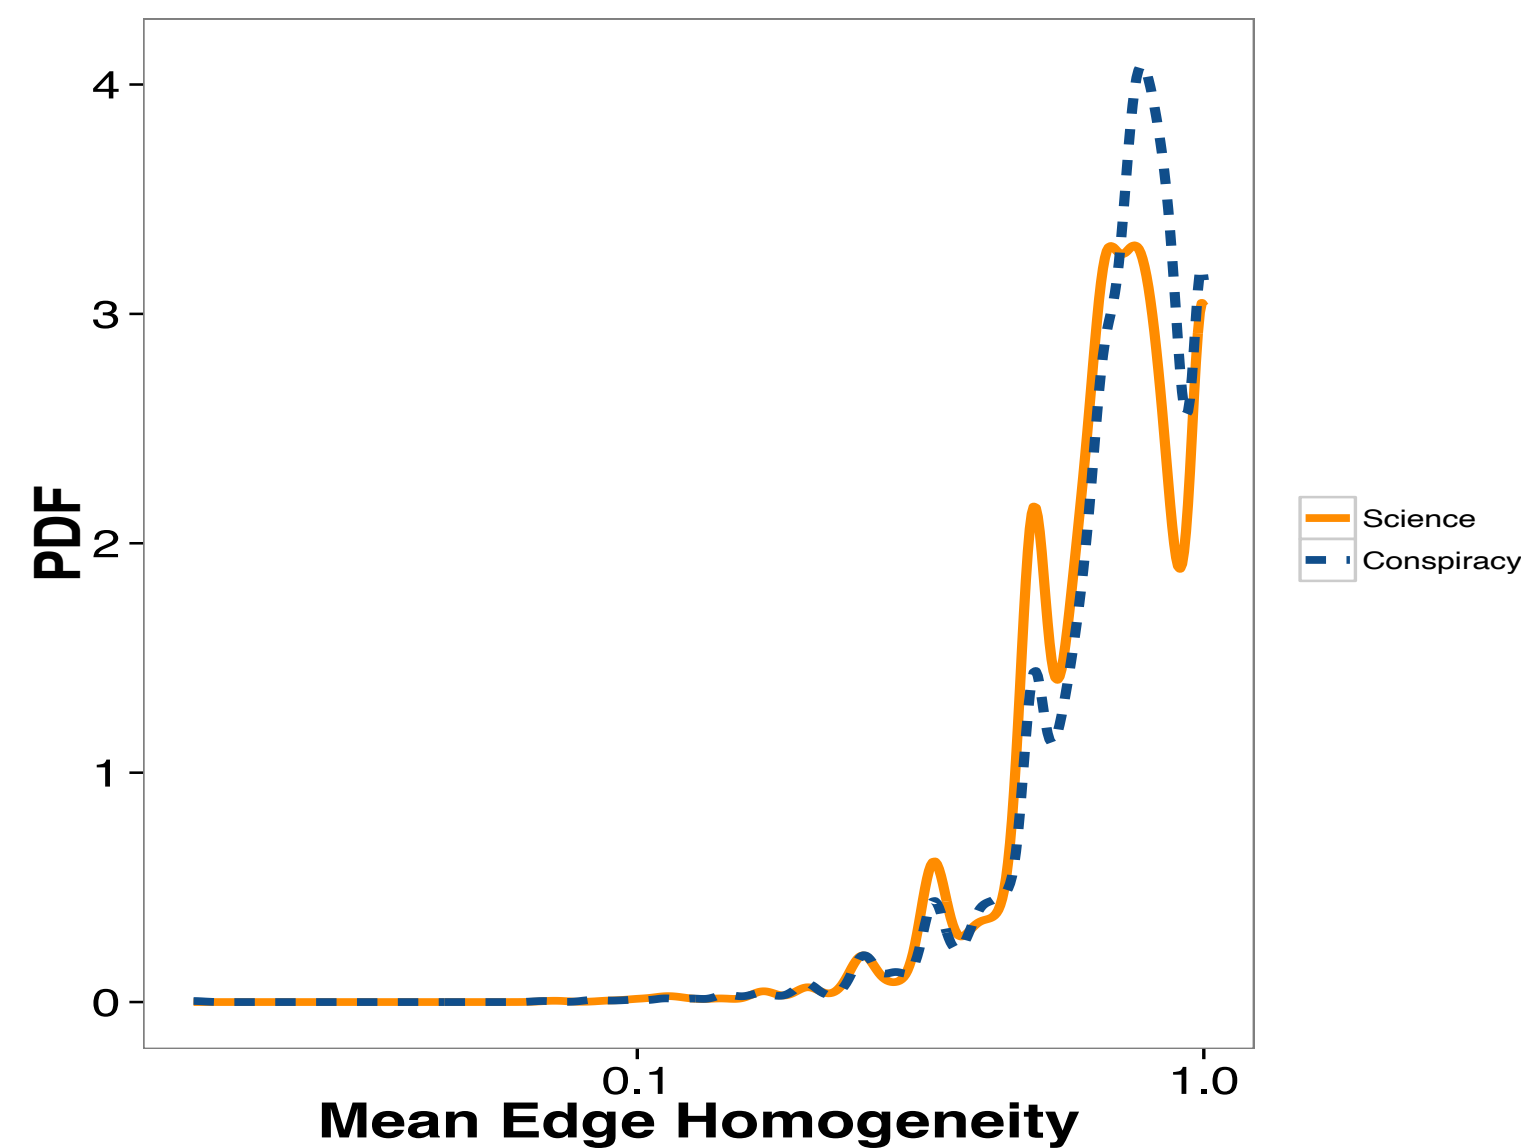

VIRAL PROCESSES AND ECHO CHAMBERS

Lifetime as a function of the cascade size for conspiracy news (left) and science news (right).

Science news quickly reach a higher diffusion, a longer lifetime does not correspond to a higher level of interest.

Conspiracy rumors are assimilated more slowly and show a positive relation between lifetime and size.

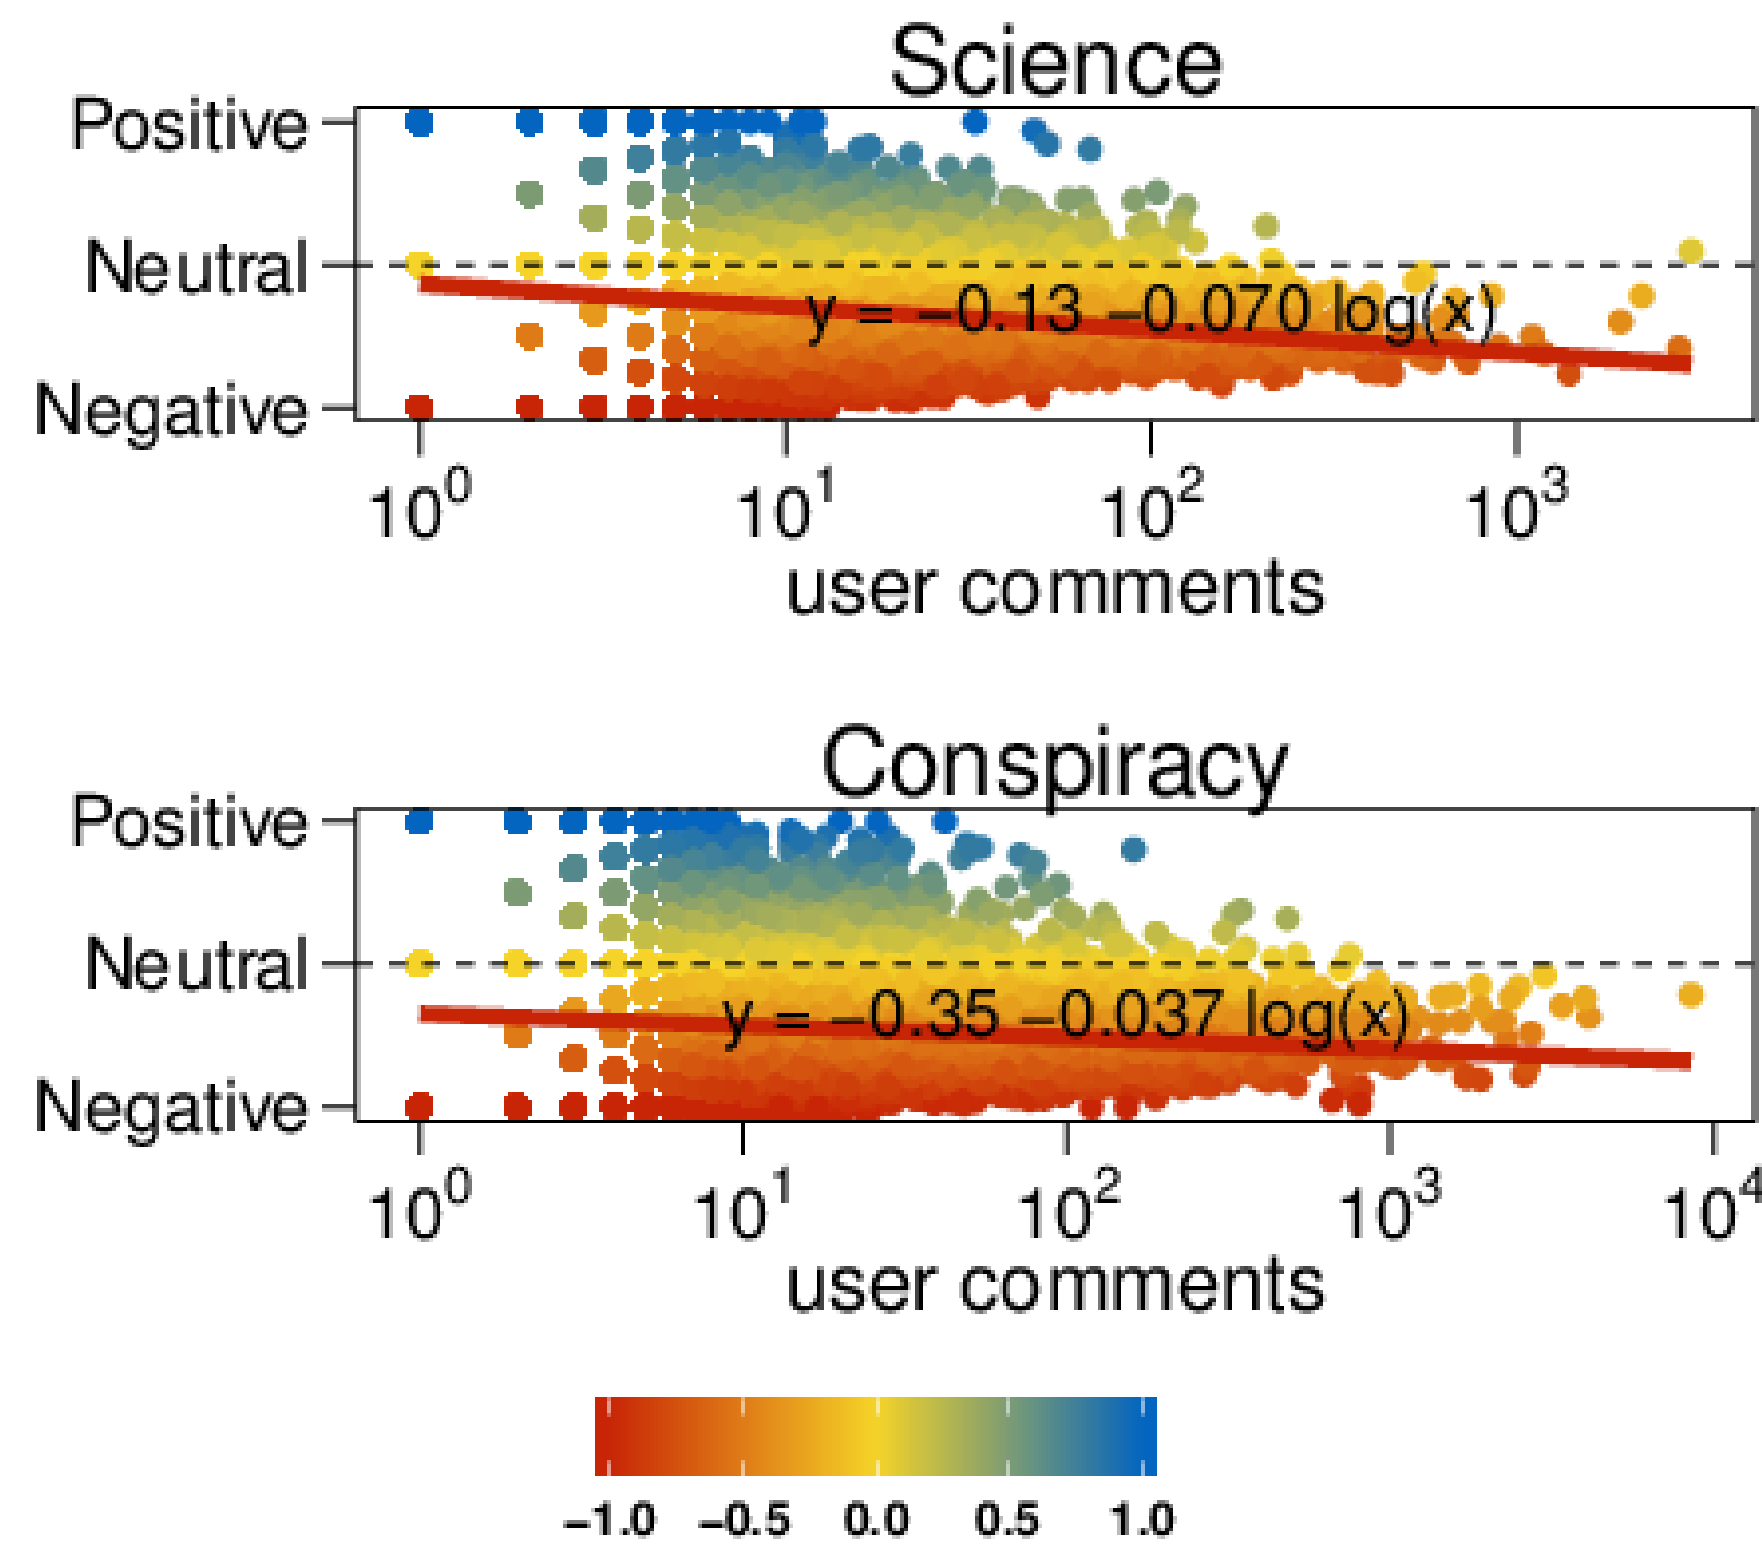

Probability density function (PDF) of edge homogeneity for science (orange) and conspiracy (blue) news.

Homophilic paths are dominant on the whole cascades for both scientific and conspiracy news.

EMOTIONAL DYNAMICS AND ECHO-CHAMBERS

DISCUSSION AND GROUP POLARIZATION

Edited by Arild Underdal, University of Oslo, Oslo, Norway, and approved January 14, 2021 (received for review November 15, 2020)

Social media may limit the exposure to diverse perspectives and favor the formation of groups of like-minded users framing and reinforcing a shared narrative, that is, echo chambers. However, the interaction paradigms among users and feed algorithms greatly vary across social media platforms. This paper explores the key differences between the main social media platforms and how they are likely to influence information spreading and echo chambers' formation. We perform a comparative analysis of more than 100 million pieces of content concerning several controversial topics (e.g., gun control, vaccination, abortion) from Gab, Facebook, Reddit, and Twitter. We quantify echo chambers over social media by two main ingredients: 1) homophily in the interaction networks and 2) bias in the information diffusion toward like-minded peers. Our results show that the aggregation of users in homophilic clusters dominate online interactions on Facebook and Twitter. We conclude the paper by directly comparing news consumption on Facebook and Reddit, finding higher segregation on Facebook.

tion and public opinion formation. In this paper, we explore the key differences between social media platforms and how they are likely to influence the formation of echo chambers or not. As recently shown in the case of selective exposure to news outlets, studies considering multiple platforms can offer a fresh view on long-debated problems (34). Different platforms offer different interaction paradigms to users, ranging from retweets and mentions on Twitter to likes and comments in groups on Facebook, thus triggering very different social dynamics (35). We introduce an operational definition of echo chambers to provide a common methodological ground to explore how different platforms influence their formation. In particular, we operationalize the two common elements that characterize echo chambers into observables that can be quantified and empirically measured, namely, 1) the inference of the user's leaning for a specific topic (e.g., politics, vaccines) and 2) the structure of their social interactions on the platform. Then, we use these elements to assess echo chambers' presence by looking
